# Integration

Homework #1

**Angel Cervera Roldan** 21319203

$$\cos(x - \frac{\pi}{2}) = \cos(x)\cos\left(-\frac{\pi}{2}\right) - \sin(x)\sin\left(-\frac{\pi}{2}\right)$$
$$= \cos(x) \cdot 0 - \sin(x) \cdot (-1)$$
$$= \sin(x)$$

$$\cos(x + \frac{\pi}{2}) = \cos(x)\cos\left(\frac{\pi}{2}\right) - \sin(x)\sin\left(\frac{\pi}{2}\right)$$
$$= \cos(x) \cdot 0 - \sin(x) \cdot (1)$$
$$= -\sin(x)$$

$$\sin(x - \frac{\pi}{2}) = \sin(x)\cos(-\frac{\pi}{2}) + \cos(x)\sin(-\frac{\pi}{2})$$
$$= \sin(x) \cdot 0 + \cos(x) \cdot (-1)$$
$$= -\cos(x)$$

$$\sin(x + \frac{\pi}{2}) = \sin(x)\cos(\frac{\pi}{2}) + \cos(x)\sin(\frac{\pi}{2})$$
$$= \sin(x) \cdot 0 + \cos(x) \cdot (1)$$
$$= \cos(x)$$

$$\cos(x - \pi) = \cos(x)\cos(-\pi) - \sin(x)\sin(-\pi)$$
$$= \cos(x) \cdot (-1) - \sin(x) \cdot 0$$
$$= -\cos(x)$$

$$\cos(x + \pi) = \cos(x)\cos(\pi) - \sin(x)\sin(\pi)$$
$$= \cos(x) \cdot (-1) - \sin(x) \cdot 0$$
$$= -\cos(x)$$

$$\sin(x - \pi) = \sin(x)\cos(-\pi) + \cos(x)\sin(-\pi)$$
$$= \sin(x) \cdot (-1) + \cos(x) \cdot 0$$
$$= -\sin(x)$$

$$\sin(x + \pi) = \sin(x)\cos(\pi) + \cos(x)\sin(\pi)$$
$$= \sin(x) \cdot (-1) + \cos(x) \cdot 0$$
$$= -\sin(x)$$

$$\cos(x - \frac{3\pi}{2}) = \cos\left(x - \pi - \frac{\pi}{2}\right)$$

$$= \cos(x - \pi)\cos\left(-\frac{\pi}{2}\right) - \sin(x - \pi)\sin\left(-\frac{\pi}{2}\right)$$

$$= -\cos(x) \cdot 0 + \sin(x) \cdot (-1)$$

$$= -\sin(x)$$

$$\cos(x + \frac{3\pi}{2}) = \cos\left(x + \pi + \frac{\pi}{2}\right)$$

$$= \cos(x + \pi)\cos\left(\frac{\pi}{2}\right) - \sin(x + \pi)\sin\left(\frac{\pi}{2}\right)$$

$$= -\cos(x) \cdot 0 + \sin(x) \cdot (1)$$

$$= \sin(x)$$

$$\sin(x - \frac{3\pi}{2}) = \sin\left(x - \pi - \frac{\pi}{2}\right)$$

$$= \sin(x - \pi)\cos\left(-\frac{\pi}{2}\right) + \cos(x - \pi)\sin\left(-\frac{\pi}{2}\right)$$

$$= -\sin(x) \cdot 0 - \cos(x) \cdot (-1)$$

$$= \cos(x)$$

$$\sin(x + \frac{3\pi}{2}) = \sin\left(x + \pi + \frac{\pi}{2}\right)$$

$$= \sin(x + \pi)\cos\left(\frac{\pi}{2}\right) + \cos(x + \pi)\sin\left(\frac{\pi}{2}\right)$$

$$= -\sin(x) \cdot 0 - \cos(x) \cdot (1)$$

$$= -\cos(x)$$

\* We had found the values of  $\cos(x - \pi)$ ,  $\cos(x + \pi)$ ,  $\sin(x - \pi)$ , and  $\sin(x + \pi)$  earlier in this question, so I replaced it for what we found earlier.

Find the inverse of the following function:

$$f(x) = x^2 - 2bx$$

Where b is a positive constant such that  $b \ge x$ .

To find the inverse, we will start by manipulating the original function until there is only one x. To do this we will try to find the value of a, c such that  $f(x) = (x + a)^2 + c$ 

$$f(x) = x2 - 2bx$$
$$= (x + a)2 + c$$
$$= x2 + 2xa + a2 + c$$

Therefore:

$$2xa = -2bx$$

$$\Rightarrow a = -b$$

$$a^{2} + c = 0$$

$$\Rightarrow c = -(b)^{2}$$

Now that we have found the values for a, c, lets verify that they actually work.

$$f(x) = (x - b)^{2} - b^{2}$$
$$= x^{2} - 2bx + b^{2} - b^{2}$$
$$= x^{2} - 2bx$$

And so those values work. Now we can find its inverse easier:

$$f(x) = (x - b)^{2} - b^{2}$$

$$f(x) + b^{2} = (x - b)^{2}$$

$$\sqrt{f(x) + b^{2}} = \pm (x - b)$$

$$\sqrt{f(x) + b^{2}} = -(x - b)$$

$$\sqrt{f(x) + b^{2}} - b = -x$$

$$b - \sqrt{f(x) + b^{2}} = x$$

Note that we only keep the negative sign as  $b \ge x$ , and so (x - b) will always be negative. However, it must equal  $\sqrt{f(x) + b^2}$ , which cannot be negative number.

#### **Answer**

$$f^{-1}(x) = b - \sqrt{x + b^2}$$

To verify that that's actually the inverse, we need to show that  $f(f^{-1}(x)) = f^{-1}(f(x)) = x$ 

$$f(f^{-1}(x)) = f(b - \sqrt{x + b^2})$$

$$= (b - \sqrt{x + b^2})^2 - 2b(b - \sqrt{x + b^2})$$

$$= b^2 - 2b\sqrt{x + b^2} + x + b^2 - 2b^2 + 2b\sqrt{x + b^2}$$

$$= x - 2b\sqrt{x + b^2} + 2b\sqrt{x + b^2} + 2b^2 - 2b^2$$

$$= x$$

$$f^{-1}(f(x)) = b - \sqrt{f(x) + b^2}$$

$$= b - \sqrt{x^2 - 2bx + b^2}$$

$$= b - \sqrt{(x - b)^2}$$

$$= b - x - b$$

$$= x$$

And because both  $f(f^{-1}(x))$  and  $f^{-1}(f(x))$  are equal to x,  $f(f^{-1}(x)) = f^{-1}(f(x))$ 

Find:

$$\lim_{x \to 0} \frac{1 - \cos x}{x \sin x}$$

$$\frac{1 - \cos x}{x \sin x} = \frac{1 - \cos^2 x}{x \sin x (1 + \cos x)}$$

$$= \frac{\sin^2 x}{x \sin x (1 + \cos x)}$$

$$= \frac{\sin x}{x (1 + \cos x)}$$

$$= \frac{\sin x}{x (1 + \cos x)}$$

$$= \frac{\sin x}{x} \cdot \frac{1}{1 + \cos x}$$

$$\therefore \lim_{x \to 0} \frac{1 - \cos x}{x \sin x} = \lim_{x \to 0} \frac{\sin x}{x} \cdot \frac{1}{1 + \cos x}$$

We know from class that:

$$\lim_{x \to 0} \frac{\sin x}{x} = 1$$

$$\lim_{x \to 0} \frac{1}{1 + \cos x} = \frac{1}{1 + \cos 0}$$

$$= \frac{1}{2}$$

Therefore,

$$\lim_{x \to 0} \frac{\sin x}{x} \cdot \frac{1}{1 + \cos x} = \lim_{x \to 0} \frac{\sin x}{x} \cdot \lim_{x \to 0} \frac{1}{1 + \cos x}$$
$$= 1 \cdot \frac{1}{2}$$
$$= \frac{1}{2}$$

And so the answer is  $\frac{1}{2}$ .

Prove the following using 
$$\epsilon - \delta$$
 
$$\lim_{x \to 3} \sqrt{4 - x} = 1$$

To show that the limit is true, we need to show that  $\forall \epsilon > 0, \exists \delta > 0$  such that

$$0 < |x - 3| < \delta \implies \left| \sqrt{4 - x} - 1 \right| < \epsilon$$

$$|\sqrt{4-x} - 1| < \epsilon$$

$$-\epsilon < \sqrt{4-x} - 1 < \epsilon$$

$$-\epsilon + 1 < \sqrt{4-x} < \epsilon + 1$$

$$(-\epsilon + 1)^2 < 4 - x < (\epsilon + 1)^2$$

$$(-\epsilon + 1)^2 - 1 < 3 - x < (\epsilon + 1)^2 - 1$$

Therefore:

$$|3-x| = |x-3| < \max(|(-\epsilon+1)^2-1|, |(\epsilon+1)^2-1|)$$

And so we can let  $\delta = \max(|(-\epsilon + 1)^2 - 1|, |(\epsilon + 1)^2 - 1|)$ . Therefore, we have found a value for delta such that the limit definition is satisfied, meaning that  $\lim_{x\to 3} \sqrt{4-x} = 1$ .

Find the asymptotes for the following function:

$$f(x) = \frac{x^2 - 4}{x^2 - 4x + 3}$$

The given function will have vertical asymptotes when the denominator of the function is 0, as the function will tend towards either positive or negative infinity at these points. f(x) can be re-written as:

$$f(x) = \frac{x^2 - 4}{(x - 1) \cdot (x - 3)}$$

This shows that f has vertical asymptotes at x = 3, and at x = 1.

To see if there are any horizontal asymptotes we need to find what the function approaches as x goes to infinity.

$$\lim_{x \to \infty} \frac{x^2 - 4}{x^2 - 4x + 3} = \lim_{x \to \infty} \frac{(x - 2) \cdot (x + 2)}{(x - 3) \cdot (x - 1)} = (\lim_{x \to \infty} \frac{x - 2}{x - 3}) \cdot (\lim_{x \to \infty} \frac{x + 2}{x - 1}) = 1 \cdot 1 = 1$$

Because it approaches 1, but it never reaches one, we know that there is a horizontal asymptote at y = 1.

At which point/s does the following function fail to be continuous?

$$f(x) = \begin{cases} x+1 & \text{for } x \ge 0\\ \frac{x}{x^2 - x - 6} & \text{for } x < 0 \end{cases}$$

x + 1 is continuous for all x, therefore, f(x) is continuous  $\forall x > 0$ .

f(x) will be continuous at x = 0 if the limit as x approaches 0 from both sides is the same and if it is defined at x = 0.

f(0) = 1, however, the limit from the negative side is the following:

$$\lim_{x \to 0^{-}} f(x) = \lim_{x \to 0} \frac{x}{x^{2} - x - 6}$$
$$= 0$$

Therefore, f(x) is not continuous at x = 0. It will also not be continuous at any points where it is undefined.

For any x < 0, f(x) will be undefined iff  $x^2 - x - 6 = 0$ , using the -b formula, we get that  $\frac{x}{x^2 - x - 6}$  is undefined at 3, and at -2, however, 3 > 0, so it is defined at that point.

Therefore, the function fails to be continuous only at x = -2 and at x = 0
